

Magreet de Pater har ISPS-INT mailen sendt denne henvisning til bl.a. Seikkula's artikel og videointerview

So in the new issue of Schizophrenia bulletin there is an article of Barbara Cornblatt:

<http://www.ncbi.nlm.nih.gov/pubmed/22080497>. She investigates which young adolescents become psychotic and which not: there is a difference in role functioning, not in symptoms. There is also an article of Barnaby Nelson about disturbance of the self, it forms an important risk factor:

<http://www.ncbi.nlm.nih.gov/pubmed/22349924>. Why I choose these two articles, they are connected I think. In adolescence people form their identity, what is needed for the forming of identity? Social experiences!! Look for the writings of Seikkula!

As you see Seikkula restores communication again.

So, yes traumas are bad for people but so **is lack of experience**, especially in adolescence, especially experience in meeting people, communicating, experiencing with social roles. I'm looking forward to those interventions which help young people to leave their rooms and go out in the world again.

Margreet
